Generalized Hyper Markov Laws For Directed Markov Random Fields

Bala Rajaratnam
Stanford University

In the recent past, classes of flexible hyper Markov laws have been proposed (and subsequently analyzed) for the purposes of high dimensional Bayesian inference in important classes of Gaussian graphical models. A shortcoming of many of these theoretical endeavors is that they are often restricted to special class of graphs (such as decomposable graphs etc...), and are therefore not always readily applicable – though they have led to rich probability and statistical theory. In this talk we propose a novel approach that aims to move beyond this restriction for the class of directed Markov Random fields.

This is joint work with Emanuel Ben-David.
